

Can the base station power supply be DC input

Overview

Base stations typically use a 48V input supply that is stepped down by DC/DC converters to 24V or 12V, then further stepped down to the many subrails ranging from 3.3V to less than 1V to power ASICs in the baseband processing stages. The MAX15258 is a high voltage multiphase boost controller with an I²C digital interface designed to support up to two MOSFET drivers and four external MOSFETs in single-phase or dual-phase boost/inverting-buck-boost configurations. With so many power rails to generate, the use of traditional. The Soetech Switch Mode Power Supply is a highly integrated outdoor 5G micro base station power supply system, it combines AC input power distribution, lightning protection, switching rectification, battery packs, DC output power distribution, Field Supervision Unit (FSU), and an outdoor chassis. • Power supplies can be employed in each of the three systems that compose wireless base stations. These three systems are known as the environmental monitoring system, the data communication system, and the power supply system.
