

Flow battery electrolyte transportation

Overview

A flow battery, or redox flow battery (after reduction-oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane. Ion transfer. Quinone-based redox flow batteries (RFBs) have emerged as promising sustainable alternatives to conventional vanadium systems, offering lower costs, high abundance and compatibility with large-scale aqueous energy storage systems. RFBs work by pumping negative and positive. This unique class of batteries is composed of energy-storing electrolytes, which are pumped through a power-generating electrochemical cell and into large storage tanks. Despite this common underlying design, a myriad of different electrolyte chemistries and electrochemical cell designs have been.
