

How to use the wall-mounted solar panel

Overview

Yes, solar panels can be mounted on a wall, either attached parallel to it, tilted at an angle, or hung as a canopy. This is usually a good option for properties with an unsuitable roof for solar panels – whether it's because of the shape or the orientation. Wall-mounted solar panels are usually less effective than roof-mounted systems because they often have a steeper angle, so they don't receive as much sunlight throughout the day. Properties that are most suited to wall-mounted solar panels are ones that have large south-facing walls, which aren't covered by any shade. South-facing panels are exposed to the sun for the longest period of the day. A homeowner in a typical three-bedroom house in the UK can expect to pay around £7,026 to buy and install a set of roof-mounted solar panels. A wall-mounted system can cost less. It'll usually take two to three days for wall-mounted solar panels to be installed – but this can vary, depending on the size of the property, the number of panels being installed, and the weather.
