

Hydrogen energy is energy storage equipment manufacturing

Overview

A sustainable hydrogen economy must be based on renewable primary energy (see Renewable energy). From an economic point of view, production must be cost-effective and climate-neutral - electrolysis will play a central role in this. Fraunhofer IFAM is extensively involved in alkaline and PEM electrolysis and is continuing to develop innovative processes. The transport and storage options for hydrogen are closely linked, diverse and depend on the use. Besides economic aspects, considerations of gravimetric or volumetric energy density are often at the center of technology selection. For cost-effective transport and storage of hydrogen, mainly non-pressurized or low-pressure processes are discussed. For the efficient use of hydrogen, the cost-effective production of consumers, i.e. fuel cells in particular, is essential. From the automotive industry to aviation and mobile hydrogen use, low-cost, high-performance fuel cells will be a key to widespread application. Fraunhofer IFAM is focusing on fast and reliable bonding processes in order to achieve this.
