

Install solar panels on the exterior wall

Overview

Yes, solar panels can be mounted on a wall, either attached parallel to it, tilted at an angle, or hung as a canopy. This is usually a good option for properties with an unsuitable roof for solar panels – whether it's because of the shape or the material. Wall-mounted solar panels are usually less effective than roof-mounted systems because they often have a steeper angle, so they don't receive as much sunlight throughout the day. Properties that are most suited to wall-mounted solar panels are ones that have large south-facing walls, which aren't covered by any shade. South-facing panels are exposed to the sun for most of the day. A homeowner in a typical three-bedroom house in the UK can expect to pay around £7,026 to buy and install a set of roof-mounted solar panels. A wall-mounted system can cost less. It'll usually take two to three days for wall-mounted solar panels to be installed – but this can vary, depending on the size of the property, the number of panels being installed, and the weather.

Solar wall

Solar walls are a technology used to passively heat a building. Similar to trombe walls or solar chimneys, solar walls are one way to achieve energy efficient building design. These walls combine exterior construction with interior devices to use solar energy to heat and ventilate indoor spaces. These walls can be installed on new buildings or can be retrofitted.
