

Is it necessary to have energy storage in photovoltaic power plants

Overview

Energy storage technologies are essential for optimizing the output from photovoltaic (PV) plants, addressing the intermittency of solar energy. The two primary types of energy storage utilized in PV systems include battery storage and thermal energy storage. Sometimes two is better than one. The reason: Solar energy is not always produced at the time. They allow the storage of surplus electricity, which contributes to greater energy independence and efficiency of the entire system. Thanks to the storage, it is possible to better manage the generated energy, which translates into higher self-consumption and reduced costs of purchasing energy from. Within the context of power plants, BESS provides the following features: Reliability Increased: Storage can be used for backup purposes. Batteries convert and store electrical energy produced by solar panels, 3.
