

Liquid-cooled energy storage with capacitor

Overview

Designing a proper thermal management system (TMS) is indispensable to the energy storage systems (ESS) of electric vehicles for reliability and safety. The high heat transfer rate and low power consumption of Li-ion battery cells are considered. A liquid-based thermal management system (TMS) is proposed to monitor the heat generation performance of a liquid cooling system for a prismatic Li-ion cell. For the present study, an active thermal management system is proposed to monitor the heat generation performance of a liquid cooling system for a prismatic Li-ion cell. For this purpose, 1D simulation tool of the MATLAB/SIMULINK® platform is utilized to extract the electrical parameters, as well as the generated heat. Also, COMSOL Multiphysics® is used. Initial conditions and boundaries of the system were set in the CFD software to verify the precision of the experiments. The turbulent flow module for the liquid cooling system and the h.
