As the development of miniaturized electronics in the ascendance, much attention is focused on the study about the construction of power-MEMS and energy storage devices for on-chip microsystems, including versatile microbatteries, microsupercapacitors, energy harvesting devices . microelectromechanical system (MEMS), micro/nanorobots, intelligent portable/wearable microsystems, and implant- able miniaturized medical devices, have pushed forward the development of specific miniaturized energy storage devices (MESDs) and their extreme manufacturing processes, as displayed in figure 1. Extreme manufacturing is specifically manifested in manufacturing with extremely high energy density, ultrahigh precision, extremely small spatial and temporal scales, extremely intensive fields, and giant systems with extreme complexity and number of factors.
