

Single-phase solar inverter inductance calculation

Overview

This paper presents closed-form equations to analytically calculate the required inductance of an LC filter in a single-phase full-bridge inverter controlled with unipolar switching pattern. This reference design implements single-phase inverter (DC-AC) control using the C2000™ F2837xD and F28004x microcontrollers. Design supports two modes of operation for the inverter. First is the voltage source mode using an output LC filter. High-efficiency, low THD. The inductance and capacitance can be calculated based on the desired ripple current and voltage. For instance, with ($L = 5$, text {mH}) and ($C = 470$, mutext {F}), the cutoff frequency is: $f_c = \frac{1}{2\pi \sqrt{LC}} \approx 1$. Electromagnetic induction is the generation of electric potential difference in a conductor when it is exposed to a varying magnetic field. Below are the related models and waveforms: $\text{shift_k} = \text{shift} * \pi / 180$; % Convert degrees to radians $a = m_a * \sin(x + \text{shift_k})$; % Reference voltage end This repository contains resources for the design, simulation, and analysis of a.
